

Card 1: Input Entry Record

Element	Description
Scenario	The Manager receives a shipment of foam and fabric for vests.
Main Actor	Warehouse Manager.
Precondition	The supplier has delivered the material and there is a prior purchase order.
Main Flow	1. The Manager accesses the "Raw Materials" module. 2. Scan or type the input code. 3. Enter the amount received. 4. The system adds the quantity to the current stock.
Result	Raw material inventory is updated and Management can see availability.

Card 2: Material Output for Production

Element	Description
Scenario	A Seamstress requests material to make a batch of 50 vests.
Main Actor	Seamstresses
Precondition	There must be sufficient stock of fabric and buckles in the warehouse
Main Flow	1. The Seamstress requests the supplies from the system. 2. The system checks if the requested quantity is available. 3. Exit is authorized and a digital voucher is generated. 4. The system automatically discounts meters of fabric from inventory.
Result	The stock of raw materials is reduced and the monitoring of "Work in Process" begins.

Card 3: Minimum Stock Alert

Element	Description
Scenario	The system detects that there are few finished surfboards left after a mass shipment.
Main Actor	Administration.
Precondition	A "Reorder Point" (minimum allowed) has been previously defined for tables.
Main Flow	1. The Shipping area records the departure of the last order. 2. The system calculates that the current stock is less than the configured minimum. 3. The system sends an automatic notification to the Administration module. 4. Administration generates a production order for Maquila.
Result	Shortages are avoided and new production of boards is planned.
